

APPARATUS FOR MOBILE TERMINAL DISPLAY

Abstract

A mobile terminal for use in a wireless communication system comprises a housing enclosing electronic components operable to transmit and receive telecommunication signals. The housing includes means for providing user input to the mobile terminal. A display is movably mounted to the housing for movement from a first position, where the display at least partially conceals the user input means of the housing, and a second position where the user input means of the housing is exposed and accessible to the user. A flip cover is pivotally mounted to the housing and movable between a closed position and an open position. The flip cover is sized to substantially conceal the display and an inner surface of the housing when in the closed position.
